Task -2

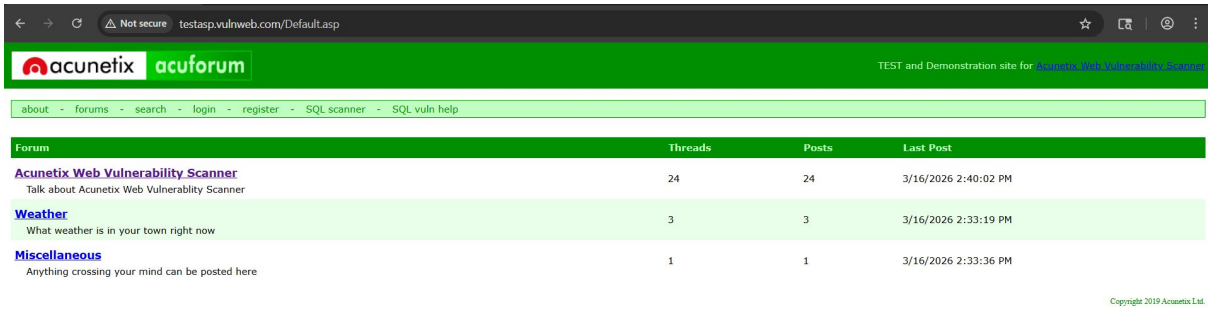
Vulnerability Assessment Report

------ Report by Pritam Bera

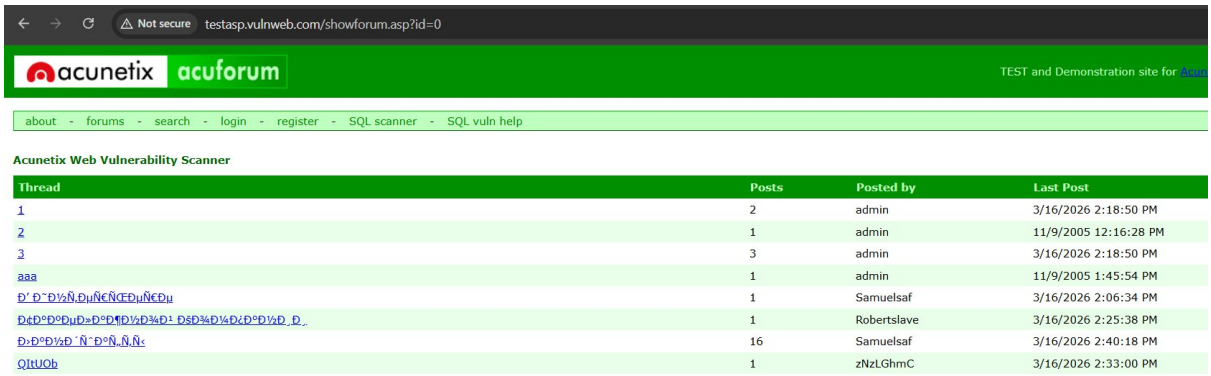
Website: http://testasp.vulnweb.com/

Date: 16/03/2026

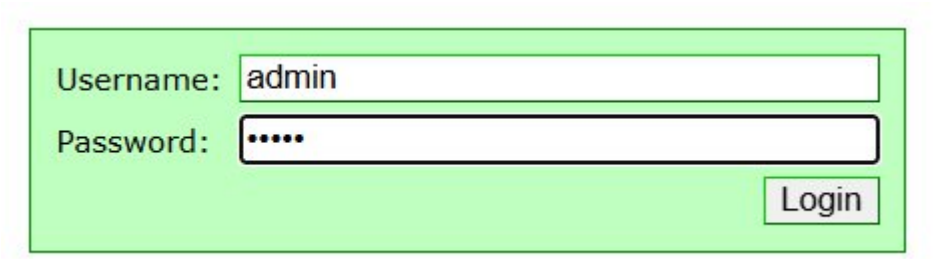
Find:1 Authentication Bypass via SQL Injection (Critical Risk)



Click “Acunetix Web Vulnerability Scanner”



First Click to login and get username: admin & password: admin

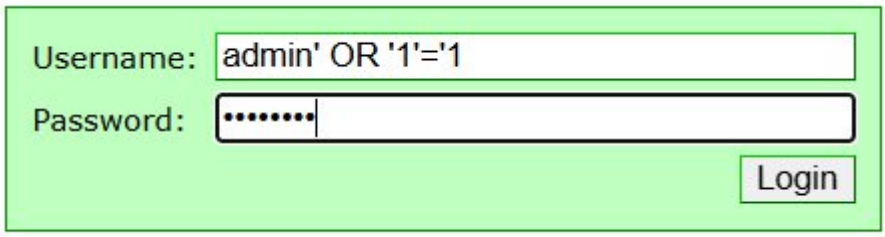


But the login invalid.

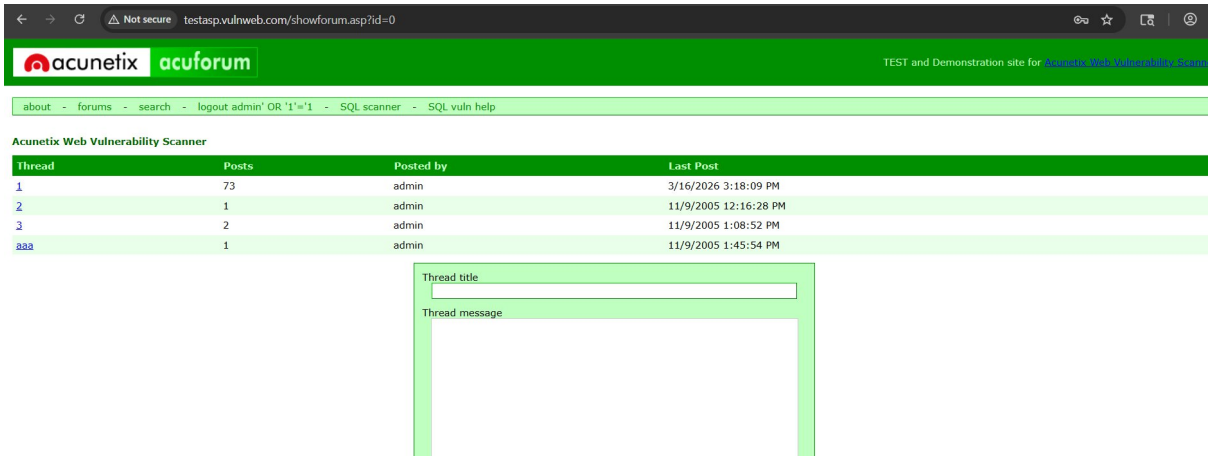
Then we use payload for username & password.

Username: **admin' OR '1'='1**

Password: **password**



Then the page will be opened.

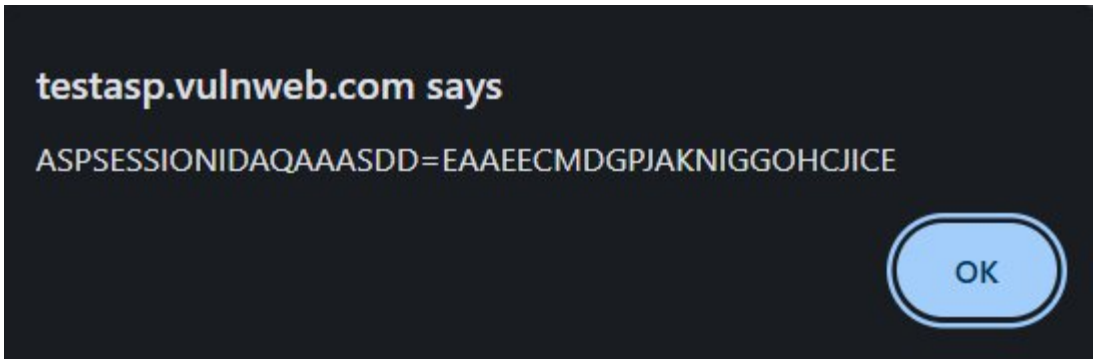


What we do?

An attacker can bypass the login mechanism and gain unauthorized administrative or user access without needing legitimate credentials.

Find: 2 Error-Based / Boolean-Based SQL Injection (High Risk)

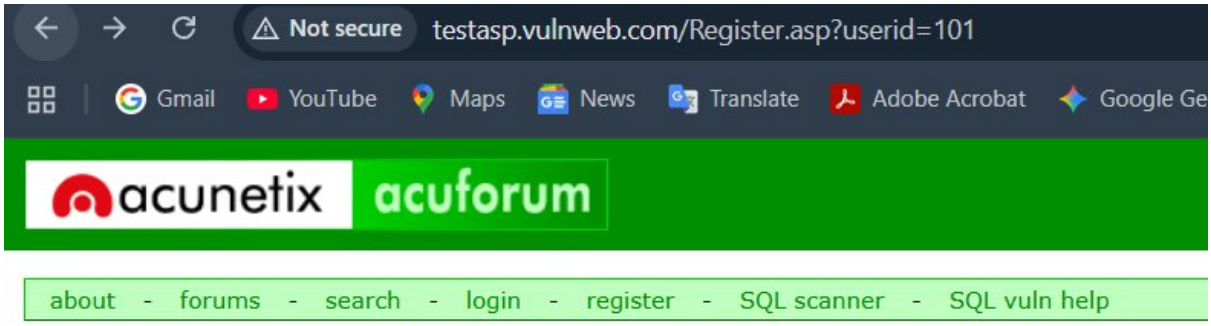
Here we used the payload inject
“ <script>alert(document.cookie)</script>” and found a key.



What we do?

Here we used a payload <script>alert(document.cookie)</script> and found the key.

Find: 3 Insecure Direct Object Reference (IDOR) / Broken Access Control (Medium Risk)



We used the url parameter **?userid=101** and **?userid=102**

But nothing happen here.

Summary: we work three investigation here 1) **Authentication Bypass via SQL Injection, 2) Error-Based / Boolean-Based SQL Injection and 3) Insecure Direct Object Reference (IDOR) / Broken Access Control** and find only the (1) & (2) is vulnerable and (3) isn't.

Thankyou.
